Lab # 2: Introduction to Programming
## EC-102 – Computer Systems and Programming

Usama Wajhi

School of Mechanical and Manufacturing Engineering (SMME),
National University of Sciences and Technology (NUST)

October 3, 2016

Outline

Lab Grading Criteria

- Lab Work and Lab Report $\sim$ 50%
    - Lab work represents your performance in lab assignments/tasks. Every student will be graded individually.
    - Lab report may be submitted by a group of max 5 students. Make sure that you submit one lab report per week.
- Projects $\sim$ 40% (details will be provided later)
- Attendance $\sim$ 10%
Lab Report: Contents

- Problem statement
- Algorithm
- Flow chart
- Code
- Conclusion

Lab Report: Title Page

- Name of school and university
- Name of subject
- Lab number and topic
- Submitted to
- Submitted by (Name and Reg No)
- Date

Basics of Computer Programming

A **computer system** is one that is able to take a set of inputs, process them and create a set of useful outputs.

One or more *input*s are used to provide data, this data is then *processed in some way* and the outcome of processing is sent to an *output* or it may be stored until some event happens and brings it to the output.

For processing to take place, there needs to be a set of instructions of what needs to be done. This set of instructions is known as a **computer program**.
Why Study Programming?

- Automation – home, industrial
Why Study Programming?

- Robotics – wheeled, aerial, humanoid

Why Study Programming?

- Computer Vision – face recognition, image filtering

Why Study Programming?

- Movies – computer generated imagery, motion capture

Why Study Programming?

- Computer Games – computer graphics, physics

Why Study Programming?

- Web Development – website design, information security
- Mobile Phones – mobile applications
- Big data Analytics – data processing, data analysis, machine learning
- Banking and Finance – financial systems simulation, policy modeling

Evolution of Programming Languages

- **Machine Language**
  - Lowest-level programming language
  - 0s and 1s
  - Easily understood by computers but is almost impossible for humans to use
- **Assembly Language**
  - English-like abbreviations such as MOV, ADD etc.
  - Translated into a machine language by a program called an assembler
  - Many instructions for even a simple task
- **High level Language**
  - Easier to understand for humans
  - A compiler is required to convert it into machine language
  - Single statement is enough to carry out many tasks

Why C++?

- **Why C++?**
  - Conciseness
  - Maintainabilty
  - Portability
- **Standardization**
  - ANSI/ISO standardization
  - Revisions – C++ 98, C++ 2003, C++ 2011, C++ 2014
- **C vs. C++**

C++

- **What is Syntax?**
- **What is Algorithm?**
- **What is Code?**

Criteria for Judging Code Quality

- Performance
- Simplicity (readability)
- Size
- Time taken
